# Integrated Pest Management

There are times when extra attention is required for the trees and shrubs on your property. Disease and insect infestations can harm or destroy their appearance and health without proper intervention.

Our Company takes a different approach to insect control and disease management. ArborScapes utilizes Integrated Pest Management (IPM) practices to care for the trees and shrubs on your property.

Integrated Pest Management is an environmentally sensitive approach of effective pest control. In years past, the traditional method of pest control has been to treat despite whether or not pests were actually present. However, today's societal concerns greatly affect the use of pesticides due to their potentially harmful nature. Keeping with true IPM standards we treat only what needs to be treated, providing effective control of pests on your property, preserving the environment, and minimizing risk to your health and safety.

One of the basic principles of IPM is viewing the entire landscape as an ecosystem, so at ArborScapes we take the necessary steps to ensure that your property is being treated as such. Our first step in addressing a pest or disease problem is to determine underlying factors that may be promoting infestations or disease. By taking and analyzing soil samples and making detailed evaluations of your trees and shrubs, we can ensure that the treatment of your property is customized to its specific needs.
